

NEON ecological forecasting workshop

May, Boulder

<https://ecoforecast.org/efi-rcn-2020-conference/>

Goal: set framework for data science competition

Initial focus

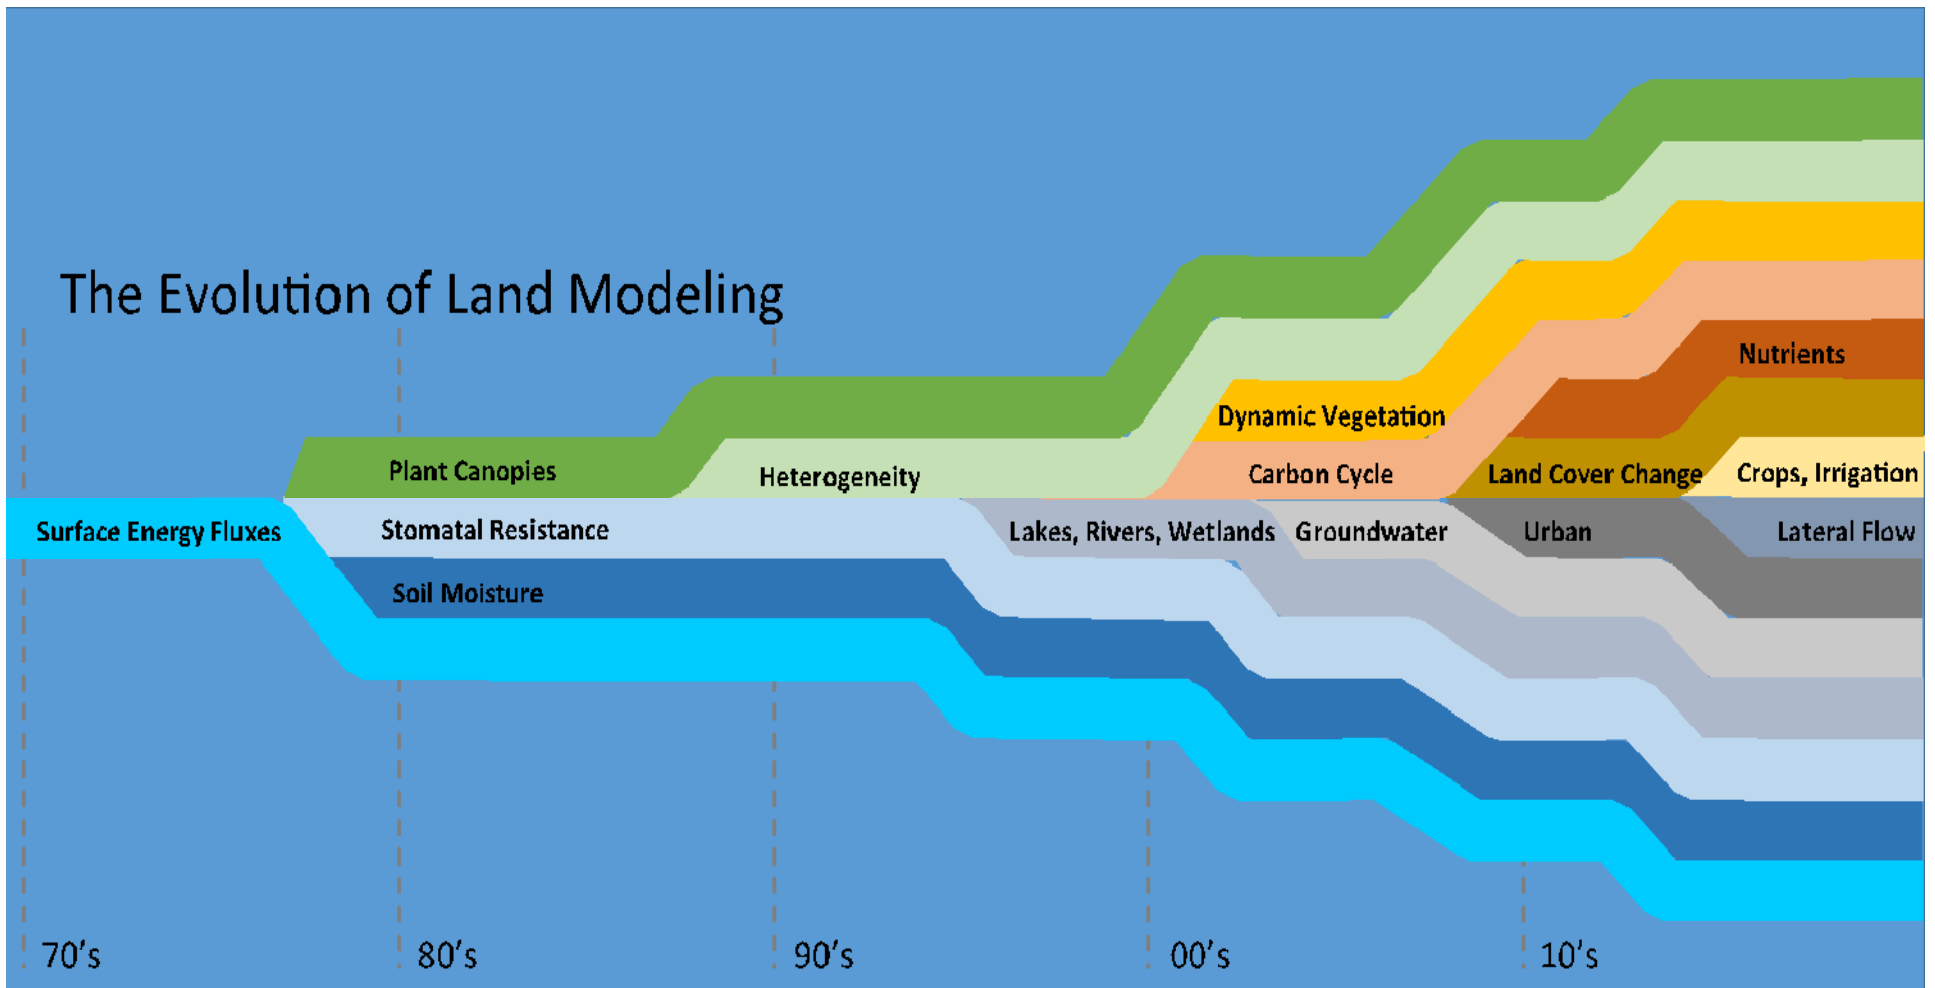

- terrestrial carbon dynamics (e.g., flux tower and inventory data)
- water quality (e.g., temperature, dissolved oxygen, chlorophyll)
- ecological populations/communities (e.g., ticks, mosquitoes, birds, community structure)

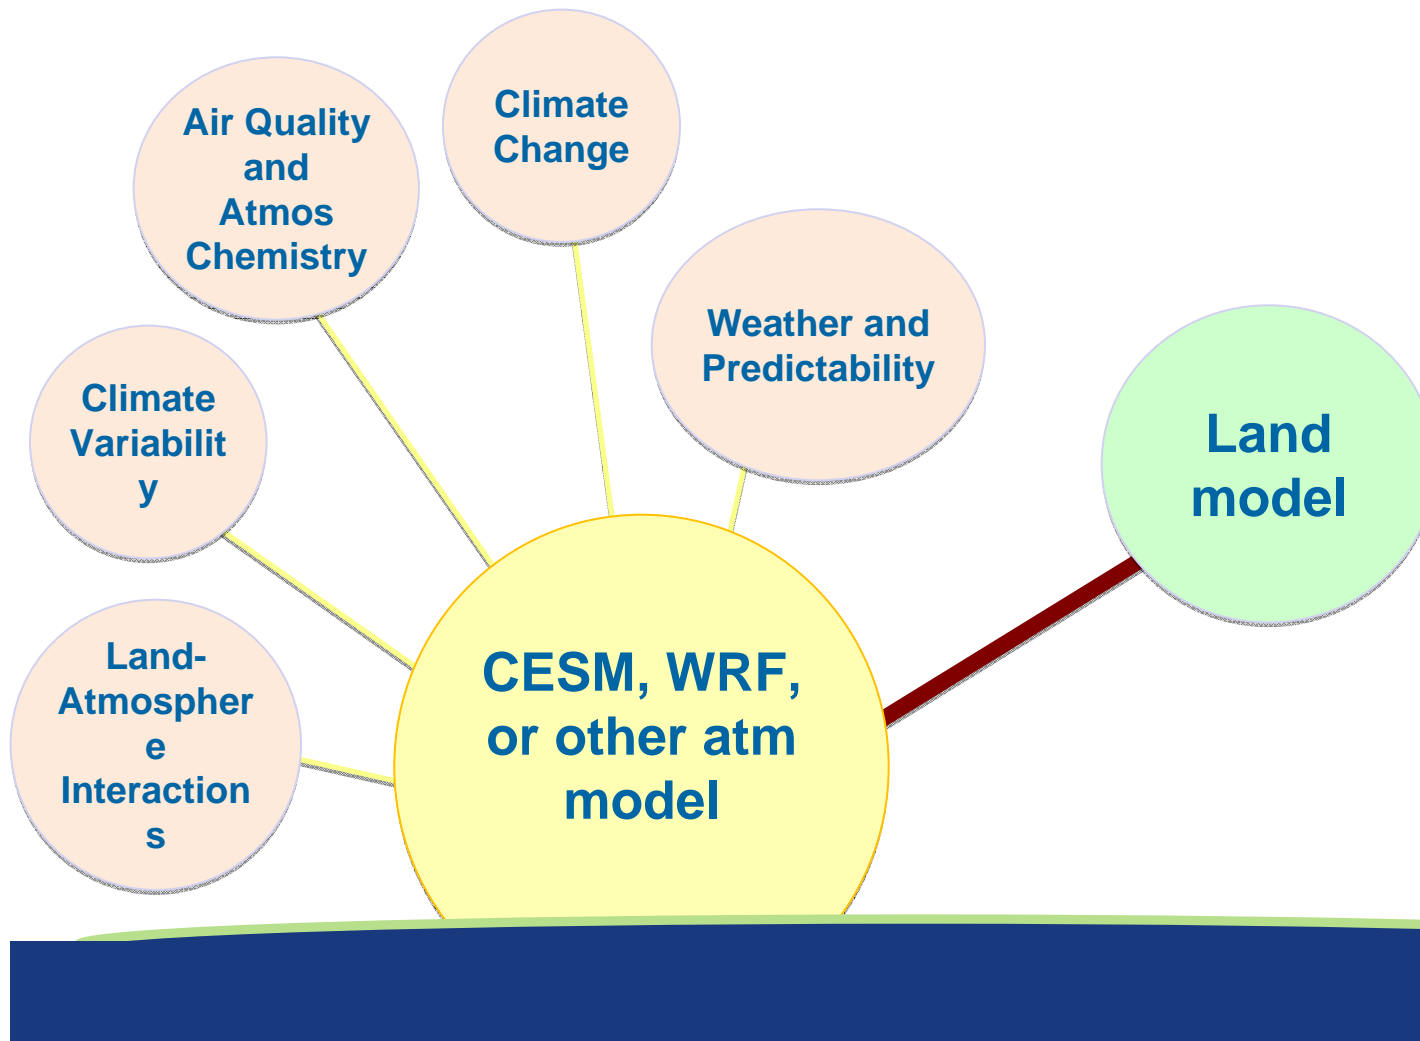

The 'evolution' of land models

Land as a lower boundary
to the atmosphere

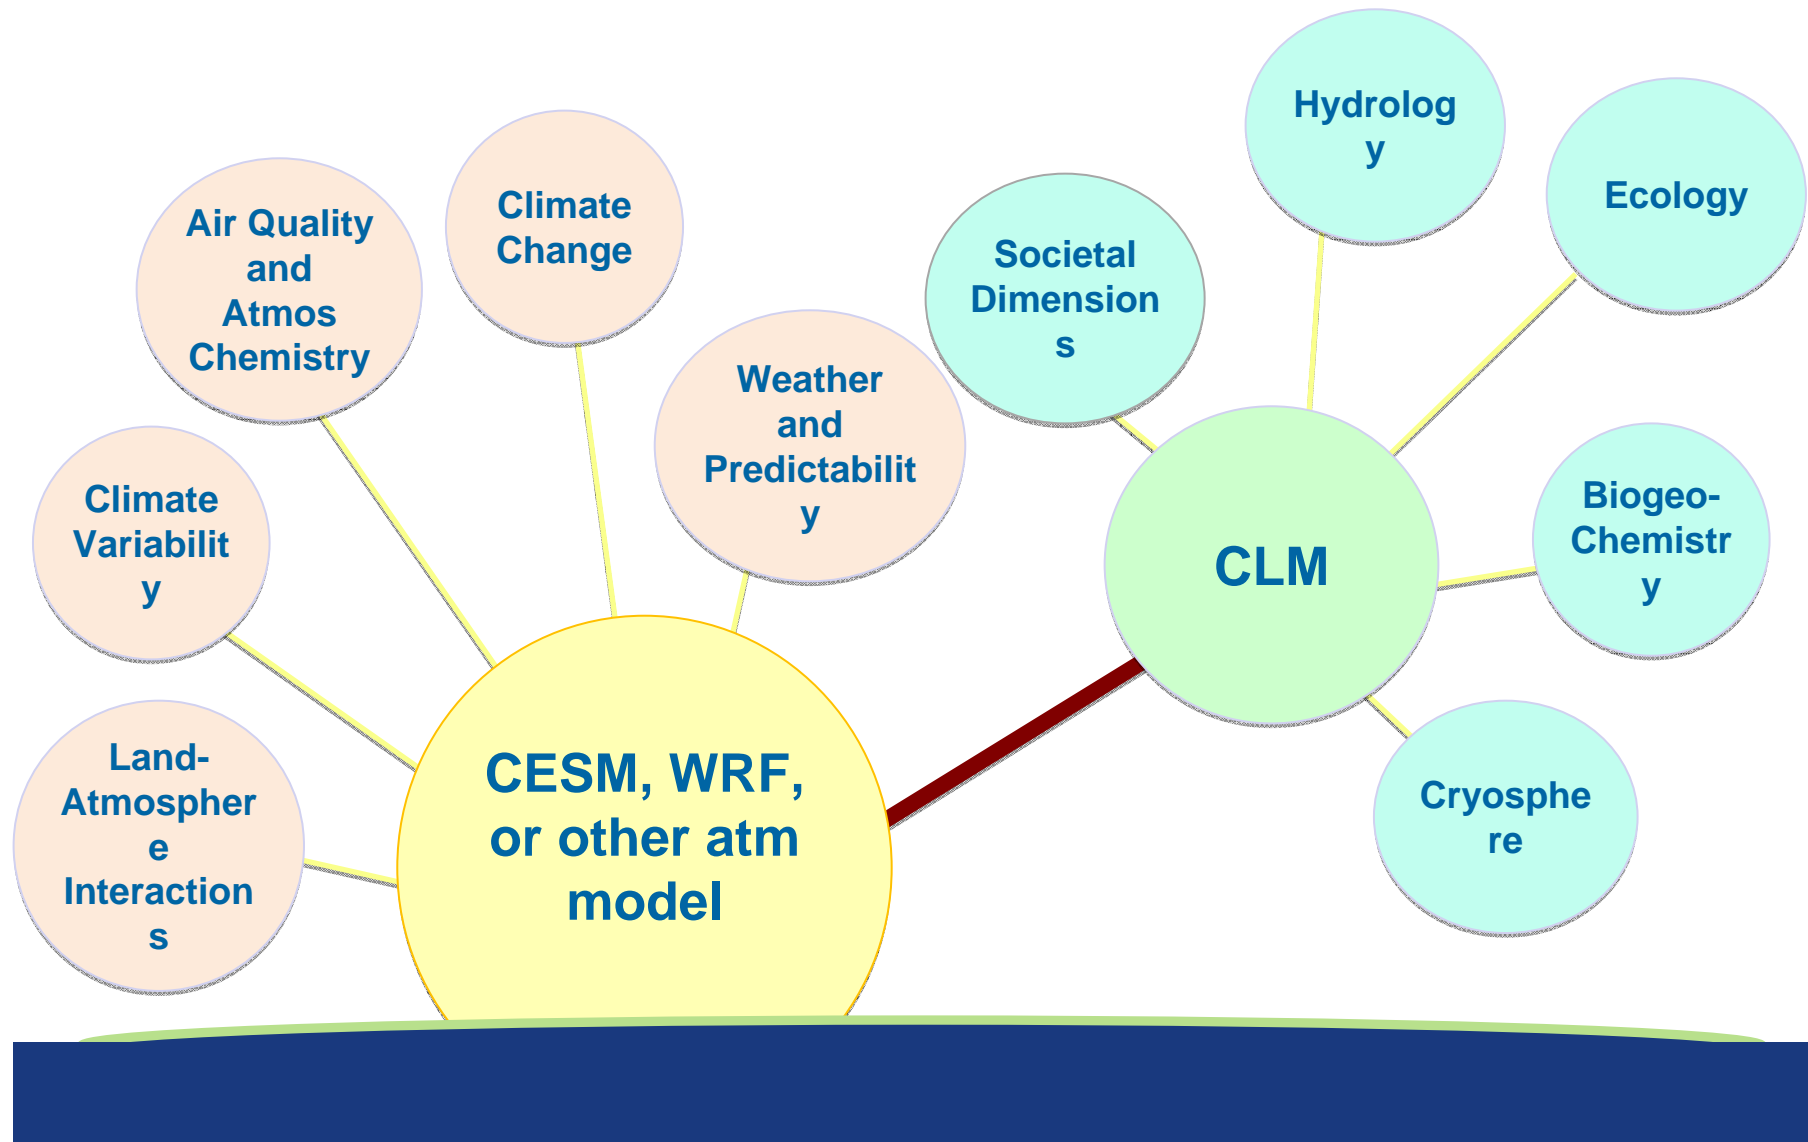

Land as an integral component
of the Earth System

R. Fisher

Land models for Earth System prediction

The Community Land Model

A Surface energy fluxes

B Hydrology

C Carbon Cycle

The Community Land Model

@ Niwot Ridge

Atmospheric Inputs

forcing

Land inputs

surface data & parameters

Model output & validation data

Sample work flow:

Inputs:

T-Van

Plant traits

Soil depth

Validation:

Snow depth

Productivity

Soil moisture & temp.

Extensions

Forecasting:

Manipulations

Future projections

Hindcast historic conditions

Questions:

Exposure to extremes

Changes in community composition

Resources

[Brainstorms for datasets](#)

Sample publications from CLM @ NWT

[Wieder et al 2017](#)

[Burns et al. 2018](#)

[Swenson et al. 2019](#)

Environmental variation and species distributions

Hypothesis: alpine species have life histories that are adapted to the amount of variation in soil moisture and how predictable it is

Possibly improve forecasting potential of Community Land Model as an input of the Species Distribution Models

Deschampsia cespitosa

Geum rossii

Forecasting changing dominance of tundra grass and forb

- general question: how and where do grasses expand with environmental change (climate, nutrients)?
- pikas: cache both species for winter forage; pikas on the ridge really need the forb for calories through the winter (cool research in the 1990s) so if the forb loses out, the pikas might also.
- main plants competing over a good portion of Niwot Ridge
- grass is beginning to gain ground in some areas
- much known about biology (could construct various models)
- CLM could be used to project key abiotic conditions

Data (lots)

- Plant species composition data for Saddle grid, 1989 – ongoing
- ~100 plots, moisture gradient
- x,y coord (10 cm) for ~10 y, every 3-5 y before that
- soil properties (1 time)
- annual snow cover/melt & total biomass
- experiments

NEON AOP
2017-2019

Niwot Ridge
subalpine

NEON carabid
beetle sampling
2015-2019

Predictor variables

Canopy gaps

Slope

Canopy cover

Aspect

Hydrology (DEM)

Litterfall/woody debris

Precipitation

... other

Rel humidity

environmental

Solar radiation

variables from

Niwot LTER,

NEON,

Ameriflux

Surface temp

Soil temp

soil moisture

Microtopography

Response: carabid abundance/occurrence with global warming

NEON: mosquito time series

- See Google Drive for a full description of this project idea

Our project ideas

- Niwot: Community land model (CLM) projections
- Niwot: Species distribution models of tundra plants
- Niwot: Changing dominance of tundra grass and forb
- NEON-Niwot: Species distribution models of forest species
- NEON: Mosquito time series
- NEON: Ticks. Can we forecast tick abundance with phenocam (and other) data? Tick borne pathogens.
- Niwot: Decoupling of temperature and growing season length in ANPP
- Predicting host states using microbial traits
